

UPS Shipping Directly in your SAP Application: clavisEspresso

Provides all "Worldship" functions – no double data entry

Using the Worldship software for parcel delivery via UPS normally means that SAP users must enter the respective data twice. The consequences are extra time and the risk of typing errors (statistically around 1 %!). clavisEspresso enables you to control the UPS delivery directly in SAP and thus to optimise your processes significantly.

The posting procedure for the UPS parcel delivery usually takes place in seven steps.

When using clavisEspresso, this process can be reduced to four steps.

All necessary functions are integrated directly into your SAP system. Thus the time per parcel is reduced from five to two minutes. Moreover the double data entry related error source is eliminated.

clavisEspressivo features

Our standard package provides the following functions:

- Automated print of UPS labels via SAP message control
- Summary manifest print and data transfer to UPS by dedicated SAP transactions
- Parcel tracking as standard function directly in SAP
- At option: Automated packing

For the data transfer to UPS we recommend the SAP Business Connector. There incur no license costs for this tool and it has excellent monitoring and security functionalities. Of course, this data transfer can also be done by means of a different middleware or download to PC, respectively.
