

Data Entry in a Jiffy in Warehouse and Shipping: clavisMobileWM

Increased efficiency by on-site posting

Working with paper and pencil is a thing of the past in most warehouses. However warehouse and delivery data are often still updated asynchronously. All information entered into mobile devices is posted with a time lag, for data is transferred only after placing the device into the docking station. Using the online solution clavisMobileWM you can enter your warehouse data directly on-site and provide them in your central system immediately – without extra process routes and without synchronisation delay.

We analyse your business processes and customise our application package according to your procedures. As soon as your warehouse has the required WLAN infrastructure, your employees are enabled to transfer any goods movement to the SAP system by use of mobile devices. The data is entered by bar code scan in a jiffy and/or simply via keyboard and it is instantly available in the connected SAP system. All relevant functional areas are optimally covered, from goods receipt via storage and supply-to-production to picking and goods issue.

With clavisMobileWM you will accomplish a better loading of your warehouse and a significant increase in productivity of storage and delivery logistics. Our software is independent of the used mobile device standard.

clavis ;

clavisMobileWM features

- Goods receipt posting and palettisation of internal production and external suppliers
- Internal putaways, stock removals and transfers
- Recording of physical inventory counts incl. document creation
- Supply-to-production and return transfer from production into storage
